

## **INSTRUCTIONS FOR PRACTICE EXAMS:**

**After reading the API documents use the Closed Book portion of these exams for your pre-exam studies concentrating on the API material only.**

**Closed book ASME material should be attempted only after completing the Sections VIII, IX and, V pre-course exercises.**

**The Open Book portion is included but it is best left until after completing the class textbook since help is required with setting up many of the ASME calculations. The step by step solutions can be used to work through the calculations within the practice exams. Remember this is an API examination, you should know the API 510 itself very well and be able to do any of the corrosion rate, remaining life etc. calculations in the closed book half of the exam.**
